Experimental Design

Biology 683

Lecture 1

Heath Blackmon

Today

- Introductions
  1. Name
  2. Lab
  3. Data
- Syllabus / website
- Big problems in stats
- Why you need this class
- Prep for Thursday

The public impression of statistics

- *Figures will not lie but liars will figure*
- *There are three kinds of lies: lies, damned lies, and statistics*
- *You can make statistics say anything*
- *Statistics are no substitute for good judgement*

Our response

Misuse of statistics is unethical

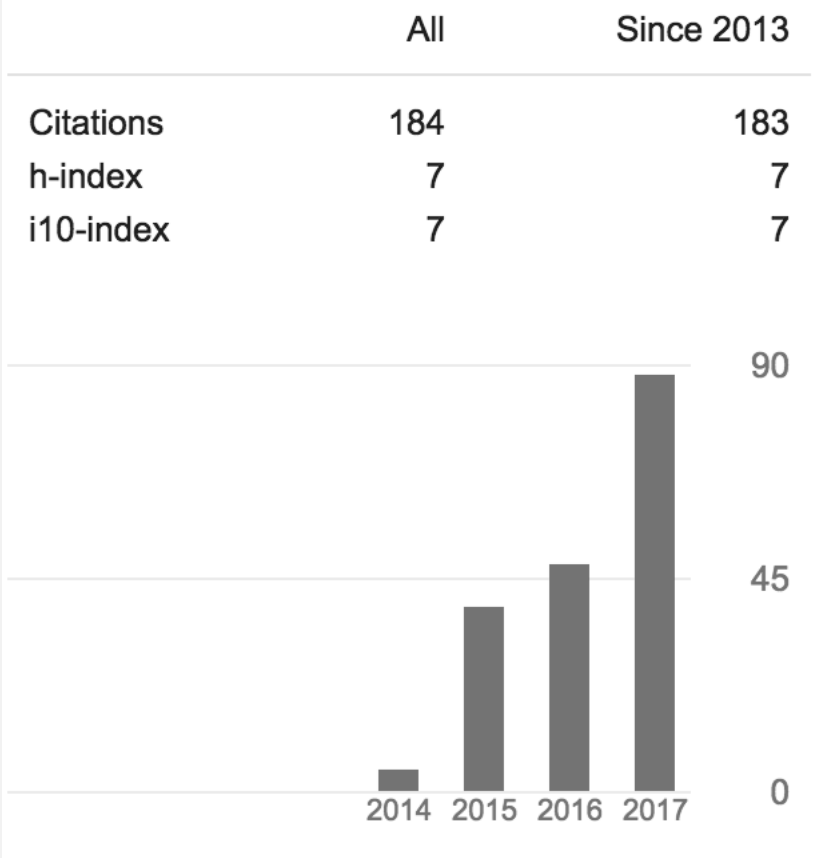
Poor training and maleficence are both responsible for failures

Statistical literacy in the general public is essential

Do your part: learn science of important topics and help friends and family understand them!

Reproducibility crisis

- Started in the social sciences but some problems are widespread
- pressure to publish
- file drawer problem
- small sample sizes
- p-hacking
- unethical researchers



Solutions

- Study preregistration
- PeerJ / PLOS ONE
- Preprint Servers
- Altimetrics
- Systemic change - unlikely

Evolution and Statistics

In many ways, therefore, modern statistics was an offshoot of evolutionary biology

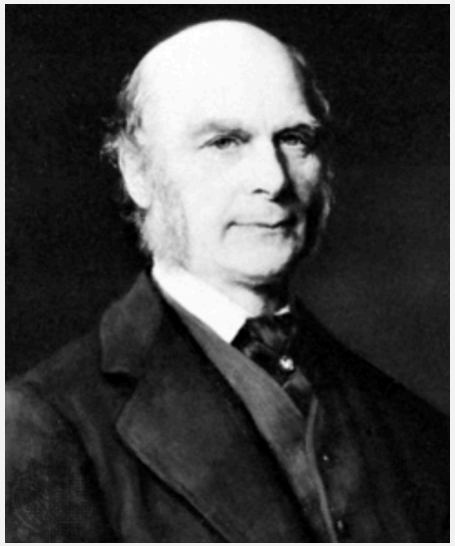
REGRESSION



Why do biologists need statistics

- We want to test hypotheses.
- To test a hypothesis we have to design an experiment
- Not all experiments have a traditional control and experimental treatment
- It is quite possible to design a study or collect data that cannot answer the questions that we have
- This leads to poor manuscripts and can lead to bad practices like p-hacking

Experimental Design

So, to design an experiment you need to understand how the data will be analyzed statistically.

1. How can you sample the population in which you are interested?
2. What tests are appropriate for your data?
3. What biases must be controlled for?
4. What sample size will be necessary?

Why not just collaborate with a statistician

1. In some cases this is a great option, but you have to understand enough to communicate.
2. If you publish a study you are responsible for its validity.
3. For most experiments simple methods suffice.
4. In many fields of biology there are sets of statistical tests that are expected for certain types of data.
5. For all of these reasons statistical analysis **needs to involve people who understand the biological problem**

My stats philosophy

- Statistics is just another tool
- My responsibility as a scientists is to report the truth as accurately as possible and statistics help me in this regard
- We may NEED statistics to discern patterns in our data
- Bayesian statistics offer a way to build on our past and ask the questions we are really interested in.

What is R

- R is a statistical programming language
- It works very similarly on all major operating systems
- It is free and open source
- The focus is on statistics and graphics
- It’s also a full-fledged high level programming language (similar to Python)
- *FYI: It can help you get you a job. - Dell, Lab Tech, Core Facility*

Why use R

1. Many statistical approaches have been implemented in the R environment.

2. Because it's open source, there are no proprietary secrets, as might be hiding in commercially available statistical packages.

3. Any program written in R will have access to all of R's tools for statistics and graphing.

4. New methods of analysis are being implemented in R by the scientists developing the methods.

Why use R

5. If you use R you can include a script with your manuscript
6. Reproducibility
7. Reviewing
8. Open Science
9. Running analyses with scripts facilitates revision of manuscripts
10. Many methods (mixed models, quantitative genetics, etc.) are only available in R.

Installing R and RStudio

Installing R

1. Go to the R homepage and click download R.
2. Pick a mirror that is in Texas or at least in the United States.
3. Select the correct version for your system and follow the prompts.

Installing Rstudio

1. Go to the RStudio homepage and click on the download link below the free version of RStudio Desktop.
2. Select the correct version for your system and follow the prompts.

For Thursday

1. Read chapters 1 and 2 of WS
2. Install R and Rstudio on a laptop
3. Come and see me **BEFORE** class on Thursday if you run into problems

Bring laptop to class!
